

TYPE 1 DIABETES

Type 1 diabetes is a chronic illness that may start in childhood. It is an autoimmune disease. People with type 1 diabetes must take insulin every day. They need to balance insulin, diet, and exercise according to a care plan created with their health care provider. They can live a long and healthy life by following their plan.

- Type 1 diabetes usually appears during childhood or adolescence. It can also develop in adults ([Mayo Clinic](#)).
- Type 1 diabetes is less common than type 2 diabetes. About 5-10% of people with diabetes have type 1 ([CDC](#)).
- Currently, no one knows how to prevent or cure type 1 diabetes. It can be successfully managed over the course of a lifetime.

What is Type 1 Diabetes?

TYPICAL

- In the human body, there is an organ called the pancreas.
- The pancreas makes insulin.
- When you eat, your body digests some foods to make glucose (sugar) that is carried in your blood.
- Blood glucose is used by your body's cells as energy.
- Insulin moves the glucose from your blood into the cells.

TYPE 1

In type 1 diabetes, the pancreas does not make enough insulin. This can cause high levels of glucose in the blood.

- High levels of glucose in the blood is called “hyperglycemia.”
- Hyperglycemia over long periods of time can damage the body. This can cause symptoms and complications.

What are Risk Factors for Type 1 Diabetes?

People with family members who have type 1 diabetes are more likely to develop it. Type 1 diabetes is NOT caused by diet or other lifestyle choices. There may be other causes, such as an environmental trigger like a virus ([BeyondT1D](#)).

Researchers are not sure what causes type 1 diabetes. There is no known way to prevent type 1 diabetes. While type 1 diabetes cannot be cured, it can be managed so people have long, healthy lives.

What are Warning Signs and Symptoms of Type 1 Diabetes?

Symptoms of type 1 diabetes can develop in a few weeks, months, or very suddenly. Symptoms can include:

- Increase in thirst.

- Increase in hunger, even after eating.

- Blurry vision.

- Increase in urination.

- Unexplained weight loss.

- Dry Mouth.

- Bed wetting in children who did not do that before.

- Feeling very tired.

- Itchy or Dry Skin.

High levels of glucose in blood can cause “diabetic ketoacidosis” or DKA. DKA is a medical emergency. Anyone with warning signs of DKA should seek care immediately. Warning signs of DKA include:

- Fruity breath.

- Feeling sick to stomach.

- Stomach pain.

- Confusion.

- Dry or flushed skin.

- Vomiting.

- Trouble breathing.

It is recommended that parents or guardians of a student displaying warning signs or symptoms of type 1 diabetes do not delay having a discussion with the student's primary care provider to determine if they need to be screened or tested.

Who Should Be Screened for Type 1 Diabetes?

Screening for type 1 diabetes is available. The screening is done by a blood test. The tests may find type 1 diabetes in early stages before symptoms are seen. Please discuss these blood tests with your health care provider.

Type 1 diabetes screening is for people who:

- Are between the ages of 2 and 45 years who have a parent, brother, or sister, or child with type 1 diabetes.
- Are between the ages of 2 and 20 years who have an aunt or uncle, cousin, grandparent, niece or nephew, or half-brother or sister with type 1 diabetes.
- Have a personal or family history of autoimmune conditions or allergic conditions.*

What are the Three Stages of Type 1 Diabetes?

After screening takes place, a health care provider may give a stage for type 1 diabetes. Breakthrough T1D describes three stages of type 1 diabetes. You may not notice symptoms in the first two stages.

STAGE 1

FOUR IN 10

people at this stage will have type 1 diabetes in five years.

Blood glucose is normal. There are diabetes-related autoantibodies in the blood. There are no symptoms of type 1 diabetes.**

STAGE 2

THREE IN FOUR

people at this stage will have type 1 diabetes in five years.

Blood glucose is NOT normal. Autoantibodies are present. There are no symptoms of type 1 diabetes.**

STAGE 3

This is when most people are diagnosed with type 1 diabetes. Type 1 diabetes symptoms are seen. Blood glucose is high.

*Some evidence also supports screening people with a personal or family history of autoimmune or allergic conditions (talk with your healthcare provider).

How Do You Manage Type 1 Diabetes?

There is no cure for type 1 diabetes. It is a lifelong disease. While there is no cure, it can be managed so that people with type 1 diabetes can live a long, healthy life.

Families and students with type 1 diabetes should work closely with their primary care provider to make a treatment plan for daily care. This plan may include appointments with specialty providers, including an endocrinologist.

Contact your student's primary care provider if you have any questions.
