

Clermont County Cancer Profile

Ohio Department of Health

2019

Introduction

Approximately four out of 10 Ohioans will be diagnosed with cancer at some point during their lifetime. Cancer is the second leading cause of death, accounting for nearly one in every four deaths in Ohio and the United States. Disparities in rates may be associated with lifestyle factors, lack of access to health care, later stage at diagnosis, inadequate treatment or other risk factors that should be addressed in cancer prevention, early detection and control initiatives. This report provides an overview of cancer in Clermont County, Ohio, including data on cancer incidence (new cases) and mortality (deaths), Ohio and U.S. comparisons, trends, stage at diagnosis and risk factors. This information can be used to increase awareness about the burden of cancer in Clermont County and to develop targeted cancer programs in the community.

Overview

- An average of 1,104 new invasive cancer cases and 395 deaths occurred each year among Clermont County residents from 2012-2016.
- In 2012-2016, the cancer incidence rate for all sites/types combined in Clermont County was 470.0 per 100,000, compared with the Ohio rate of 461.9 per 100,000 and the U.S. rate of 442.0 per 100,000.
- The 2012-2016 cancer mortality rate in Clermont County was 171.5 per 100,000, compared with the Ohio rate of 176.8 per 100,000 and the U.S. rate of 161.0 per 100,000.
- Cancer incidence and mortality rates among males were higher than the rates for females in Clermont County, Ohio and the United States in 2012-2016. Whites had higher cancer incidence and mortality rates in Clermont County during this time period.

Leading Cancers

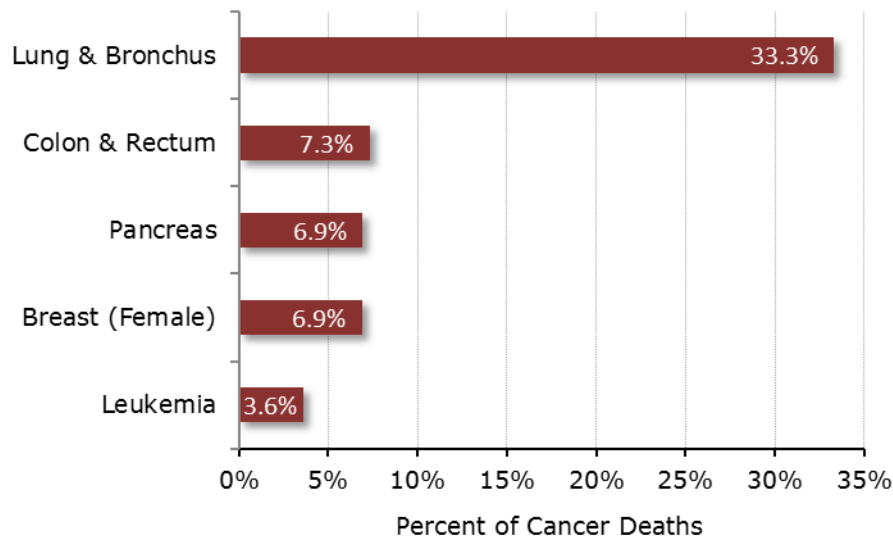

Figure 1. Percentage of Cancer Cases by Site/Type for the Top Five Cancers in Clermont County, 2012-2016¹

The leading sites/types of cancer incidence in Clermont County in 2012-2016 were lung and bronchus, female breast, prostate, colon and rectum, and melanoma of the skin, representing 55 percent of all invasive cancer cases.

¹ Source: Ohio Cancer Incidence Surveillance System, Ohio Department of Health, 2019.

Figure 2. Percentage of Cancer Deaths by Site/Type for the Top Five Cancers in Clermont County, 2012-2016¹

The leading sites/types of cancer mortality in Clermont County in 2012-2016 were lung and bronchus, colon and rectum, pancreas, female breast and leukemia, representing 58 percent of all cancer deaths.

¹ Source: Bureau of Vital Statistics, Ohio Department of Health, 2019.

Lung and bronchus cancer was the leading cause of cancer incidence and mortality in Clermont County in 2012-2016, accounting for 17.1 percent of cancer cases and 33.3 percent of cancer deaths.

³ Early and late stage values do not add up to 100 percent because unstaged/missing stage cancers are not included.

Cancer stage at diagnosis is the extent or spread of the tumor from the site of origin. The stages, in order of increasing spread, are *in situ*, local, regional and distant. Early stage cancers are those diagnosed at the *in situ* or local stage, and late stage cancers are those diagnosed at the regional or distant stage. Cancers may also be reported as unstaged or with a missing stage (not shown). Regular screening can result in the detection of these cancers at earlier stages, when treatment is more likely to be successful.

- Among the cancers selected, those with the highest proportions of late-stage tumors in Clermont County were oral cavity and pharynx cancer (69.7 percent), followed by lung and bronchus cancer (69.4 percent), and colon and rectum cancer (51.7 percent).
- Cancer sites/types with a higher percentage of late stage tumors in Clermont County compared to Ohio include oral cavity and pharynx. Please note that the percentage of unstaged/missing stage cases varies by cancer site/type and region; therefore, comparisons between Clermont County, Ohio and the United States should be interpreted with caution.

Risk Factors

Table 4. Percent of Adults who are Current Smokers, Obese or Physically Inactive in Clermont County with Comparison to Ohio and the United States, 2015, 2016¹

Risk Factor	Clermont County	Ohio	U.S.
Current Smoker	20.6	22.5	17
Obese	34.6	31.8	29
Physically Inactive	24.5	24.6	22

¹ Source: County Health Rankings, www.countyhealthrankings.org, 2019. Current smoker data are from 2016, and obesity and physical inactivity data are from 2015.

Current Smoker = Percentage of adults who are current smokers

Obese = Percentage of adults with a body mass index (BMI) ≥ 30

Physically Inactive = Percentage of adults that reported no leisure-time physical activity in the past 30 days

A cancer risk factor is anything that increases a person's risk of developing cancer. Modifiable cancer risk factors include health behaviors and lifestyle factors (e.g., tobacco use, obesity and physical inactivity). It is often not just one factor that increases a person's risk of developing cancer; rather, cancer most often results from a complex interaction of multiple factors.

- The percentage of adults in Clermont County who are current smokers is 20.6 percent, compared to 22.5 percent in Ohio and 17 percent in the United States.
- The percentage of adults who are obese in Clermont County is 34.6 percent, compared to 31.8 percent in Ohio and 29 percent in the United States.
- The percentage of adults that report no leisure-time physical activity in Clermont County is 24.5 percent, compared to 24.6 percent in Ohio and 22 percent in the United States.

Did You Know?

- Tobacco use is associated with 12 types of cancer. Nearly one-third of all cancer deaths could be prevented by eliminating tobacco use.
- Overweight and obesity are associated with at least 13 types of cancer. Nearly one-fifth of cancer deaths could be prevented by adopting healthy diet and exercise practices.
